Antimicrobial resistance: From a global problem to a local crisis? 

5 alarming facts

- Up to 99% of all nosocomial infections could be prevented by correct hand disinfection. 
- A multimodal solution for data transfer by up to 99%. 
- Hand disinfection compliance rates are known to be inadequate: when there are reminders in the form of infrastructures, the compliance increases by 40%.
- Up to 40% of all nosocomial infections are caused by drug-resistant bacteria, which can be inactivated by alcohol-based hand disinfection.
- A multimodal solution can increase the reduction of infection rates and costs by the same factor. The savings of one US dollar invested in a multimodal hygiene program of the Hand Hygiene Evolution Concept results in added value per day.
